Press Jaws

ROTHENBERGER press clamps are suitable for all press tools with a compatible press jaw fixture and a constant axial shearing force of 32 to 34 kN.

NOTE: Press jaws are subject to wear like all tools and should be examined periodically for damage. In order to ensure proper functionality of the jaws, we recommend regular maintenance at the time of annual press tool inspection, or every 10,000 crimps. If damage is evident, the press jaw should not be used until it can be sent to your nearest authorized press tool service center for inspection and any necessary repairs.

Meeting today's stringent safety standards is essential.

Greenlee's certification of selected instruments to both the most recent IEC and UL requirements brings you assurance of the highest level of protection currently available.

What you should know about Measurement Category ratings.

IEC Category standards specify protection levels that are far above a system's rated capacity. Without this additional protection, transient overvoltages, which are becoming increasingly common, can lead to serious injury or death.

Measurement Category I is the signal level for telecommunications and electronic equipment.

Measurement Category II is the local level for fixed or nonfixed powered devices – everything from lighting to appliances to office equipment such as copiers. May also be used in Category I areas.

Measurement Category III is the distribution level – fixed primary feeders or branch circuits. These circuits are usually separated from Category IV (whether utility service or other high-voltage source) by a minimum of one level of transformer isolation.

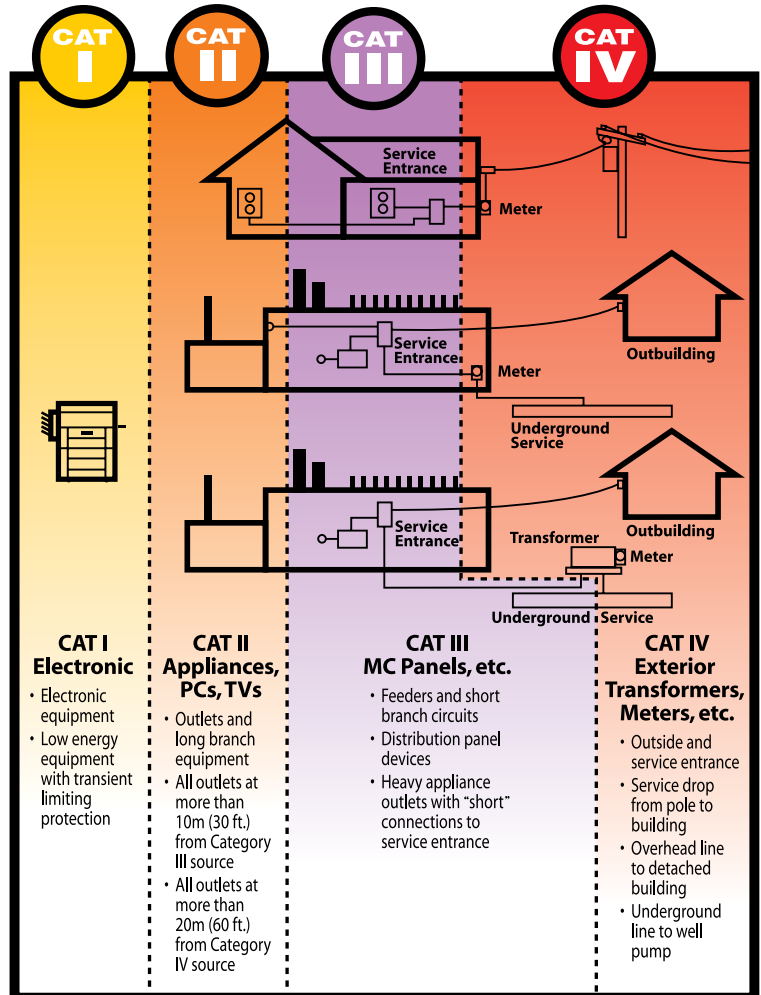

Measurement Category IV is the primary supply level. Greenlee is leading the way in offering protection certified to conform with the highest level of protection as specified by UL & IEC standards. May be used in all Category environments.

Greenlee Instruments – Independently tested and certified to meet the standards.

Throughout this catalog, you'll see Category designations for many Greenlee instruments indicating that they comply with UL & IEC Category II, III, IV. All of these designations reflect third-party testing by independent testing organizations such as UL and TUV – added assurance for you. While there is no requirement for independent verification, we believe you deserve it.

Get the right protection for the job.

Wherever you need overvoltage protection, choose at least the rating appropriate to the type of work you expect to be doing. If you have any questions on using Greenlee test instruments to help ensure user safety, please contact Greenlee.

1. Will operate on energized circuits in limited applications. Will not locate and identify a particular breaker or fuse, but will identify breakers or fuses that share a common bus.
 2. Good earth ground required. Attach one prong of transmitter to shield of the cable and the other prong to a good earth ground (such as water pipe, metal building frame, etc.).
 3. For circuits without power, hook-up a 9V battery in series with the circuit and transmitter to power the line.
 4. Closed circuit applications only.
 5. Depends on application – shorter distances for open circuit tracing, longer distances for closed circuit tracing applications.

D'VersiBITS & ACCESSORIES

D'VersiBIT® System

A new twist to an old problem.

These flexible steel drill bits are the right tools for installing wire or cable inside existing walls.

It bends to meet your needs!

Fishing wire or cable through existing walls used to be frustrating and time-consuming, but the D'VersiBIT has made it as simple as bowing the spring steel shaft in the direction you want to drill and turning on the power. Proven in the field to deliver accurate and professional results in many applications. Bits range from 3/16" to 1" (4.8 to 25.4 mm) in diameter and in shaft length from 12" to 72" (304.8 to 1828.8 mm).

The D'VersiBIT® System makes it possible to easily accomplish even complex installations. This patented system attaches a quality drill bit to a long flexible spring steel shaft. When used with the Placement Tool, this flexibility makes it possible to easily manipulate the bit within walls. After drilling, attach a D'VersiGRIP to the hole in the drill and pull wire or cable back through the wall.

Type M, Masonry

- For drilling in masonry walls and through plaster.
- Recommended for use with Abrasion Shield to reduce friction and abrasion as the shaft turns against masonry.

Type HS, Wood

- Designed for aggressive cutting in all types of wood.
- Made from high-speed steel to ensure long life.
- Replaces Bellhanger bits on 12", 18" and 24" lengths.

HOLE SAWS

Bi-Metal Hole Saws

- Cut through steel, tin, aluminum, fiberglass, wood and plastic.
- Deep 1-5/8" (41.3 mm) cutting depth allows for cutting through 2" x 4" wood studs.
- Extra-tough M42 alloy blade – we use the highest grade of tool steel to outlast competitor's blades. That beats premature saw replacement and saves you money.
- Steam oxide finish – no paint to gum up and slow cutting. The saw runs cooler for longer life and better performance.
- Extra-thick backplate minimizes vibration for smoother, easier, less tiring cutting.
- Made in USA

UG5 Ultra GLIDER™ Cable Pulling Lubrication System

NEW

The Greenlee UG5 Ultra Glider™ is the “new way” to effectively apply cable lube during cable installation. The Ultra GLIDER™ has several advantages over the manual method used by most contractors today.

- Applies lube more evenly around the cable and more consistently than can be done by hand. This reduces the force required by the cable puller and reduces the chance for damage to the cable.
- During a cable pull, the person feeding the cable usually can also operate the Ultra GLIDER™, which reduces the need for one person on the job.
- Eliminates the need for a person to place their hands near the point where the cable enters the conduit or duct.
- Eliminates the mess and slippery surfaces associated with manual cable lubrication.
- Applicators clean easily with water. Power unit and hose do not require cleaning between jobs.

Cable Lubricant Quantity Chart

The following equation is a general guideline to determine the amount of cable lubricant to use for an average cable pull.

$$Q = 0.0015 \times L \times D$$

Where:

- Q = Quantity of cable lubricant to use in gallons
- L = Length of cable pull in feet
- D = Diameter of conduit or duct in inches

If the following situations apply, consider using additional lubricant:

- The cable jacket is hard and/or cable is very stiff.
- The conduit is rough or dirty.
- There are many bends to pull through.
- The percentage of conduit filled by the cable is unusually high.
- The conduit is water filled.

Cable Preparation Instructions for Set Screw Clamp-Type Pulling Grips

Strip cable approximately 3" (76 mm) of insulation off the end of the cable to be pulled. **NOTE:** The grip head should not be more than 60% filled nor less than 40% filled to assure that the set screw does not project above the surface of the grip body when the set screws are tightened down.

The central core should be clipped away and the outer strands used in the grip head.

Using the Allen Wrench provided, back out the set screws far enough to accommodate the stripped cables.

Insert the bare wire strands into the grip head as far as they will go.

Tighten both set screws in each grip securely against the conductors.

CAUTION: If the set screws extend above the surface of the gripping head, damage to the conduit could result. To prevent this, wrap the head with electrical tape.

Pulling Grip Selection Guide

How to select correct pulling grip:

1. Select the type of grip needed.
2. Select the size of grip needed (see below).
3. Select a grip with maximum rated capacity that meets or exceeds the cable puller's maximum pulling force.

1. SELECT THE TYPE OF GRIP NEEDED.

GRIP TYPE	DESCRIPTION	TYPE OF EYE	SIZE RANGE DIA. INCHES (mm)	MAX. RATED CAPACITY – LBS. (kN)	USE TO PULL
Junior Grips	Single weave galvanized steel mesh	Flexible	.19-1.24 (4.8-31.5)	708 (3.5)	In conduit or tray – Building wire by hand.
Light Duty Grips	Single weave galvanized steel mesh	Flexible	.50-3.99 (12.7-101.3)	2940 (13.1)	In conduit or tray – Light-duty applications, short easy runs.
T-Type Grips	Double weave galvanized steel mesh	Flexible	.50-3.99 (12.7-101.3)	6200 (27.6)	In conduit or tray – Medium-duty applications
K-Type Grips	Double weave galvanized steel mesh	Rotating forged	.50-6.99 (12.7-177.5)	9600 (42.7)	In conduit or tray – Heavy-duty applications, long hard runs.
Multiple Strength Grips	Triple to double to single weave galvanized steel mesh	Rotating forged	.25-3.99 (6.4-101.3)	9600 (42.7)	Overhead transmission lines – Bare or insulated conductors, wire rope.
Slack Grips Rod Closing	Double weave galvanized steel mesh – rod closing – offset eye	Flexible	.50-3.99 (12.7-101.3)	2400 (10.7)	Where end of conductor is not available. Can be pulled straight only, rod will not flex.

2. SELECT THE SIZE OF GRIP NEEDED.

After determining the type of grip needed, measure the diameter of the cable being pulled. If pulling more than one cable "of the same diameter," refer to chart below for required grip diameter range. If pulling more than one cable "of different diameters," bundle cables together, measure the circumference

and refer to the chart on bottom of this page for required grip diameter range. Once the cable diameter or required grip diameter is determined, refer to individual chart for type of grip chosen to locate Catalog/UPC number.

CRIMPING AND CUTTING TOOLS

EK425L Gator® Battery Powered Crimping Tool

With the new 6-ton Greenlee Utility EK425L tools, Greenlee has taken the best in class EK425 and packed it with additional exclusive features to make the crimping task faster and easier while providing assurance that each crimp is complete.

The EK425L is operated with one hand, leaving the other hand free to position the cable and connector. The crimping jaws open wide to fit easily over connectors. To help prepare for a crimp, the jaws can be jogged closed until they just grip the connector, allowing the operator to position the cable in the connector before finishing the crimp. The EK425L will complete about 325 crimps per battery charge on 4/0 AWG splices. When a crimp is fully completed, the EK425L signals the operator by automatically opening the jaws. It is then ready to make the next crimp. And, when the crimping jaws need to be opened before a crimp is complete, the operator can simply push a button on the back side of the tool.

SAFETY FIRST

The following are reminders and not intended to replace reading instruction manuals and other safety information.

- Observe all Safety Precautions included in the Operator's, Service, and Parts Manual shipped with each product.
- For your personal safety read and understand all instructions and warnings before using a product.
- Inspect tools, equipment, and other products before using; replace damaged, missing, or worn parts with genuine Greenlee or Greenlee Utility replacement parts.
- Make sure all hydraulic connections are clean and tight. Replace damaged or worn hoses before using.
- Do not overreach when operating tool. Always keep proper footing and balance.
- Use with specified hydraulic power unit only.
- Use all appropriate and applicable personal safety equipment as required, such as: safety shoes, hard hat, safety glasses or face shield, etc.

GLOSSARY OF HYDRAULIC TERMS

Accumulator: A container in which fluid is stored under pressure; it functions as source of fluid power, and can also absorb or cushion pressure surges in the hydraulic system.

Backpressure: Pressure that works against the flow of hydraulic fluid through a hydraulic system.

Bar: A metric unit of pressure; equal to approximately 14.5 psi.

Body Piece: The female fitting of a quick-connect coupler group. See Nose Piece.

Cavitation: A condition in which the hydraulic pump is unable to draw fluid.

Closed-Center: A constant-pressure hydraulic system or tool; the pump output is not unloaded to the reservoir when the tool is in the neutral position, and the pressure at the pump outlet is maintained at the maximum pressure control setting. See Open-Center.

Cooler: A heat exchanger; used to remove heat from the hydraulic fluid.

Coupler: Any device used to connect hydraulic components together; same as Fitting.

Directional Spool: A valve which directs the flow of hydraulic fluid to a particular channel or passageway.

Double-Acting: A hydraulic cylinder or tool that allows fluid force in two directions; see Single-Acting.

Fitting: Any device used to connect hydraulic components together; same as Coupler.

Flow: The movement of hydraulic fluid, caused by a difference in pressure between two points; measured in a quantity per unit of time, such as gpm (gallons per minute) or lpm (liters per minute).

Flow Control Valve: A valve which controls the rate of fluid flow.

Four-Port Valve: A directional control valve with four flow paths; see Two-Port Valve.

gpm: Gallons per minute; a measure of hydraulic fluid flow. See Flow.

Head: The height of a column of fluid above a particular point, measured in linear units; pressure is equal to the height multiplied by the density of the fluid.

High Pressure: 207 Bar (3000 psi) or more of hydraulic pressure; see Low Pressure.

Horsepower: The amount of power required to lift 550 pounds one foot in one second; one horsepower is equivalent to 746 watts or 42.4 BTU (British Thermal Units) per minute. Abbreviated hp.

HTMA: The Hydraulic Tool Manufacturers Association; a group of manufacturers of hand-held hydraulic tools.

Hydraulic Fluid: A liquid that is specially compounded for transmitting power in a hydraulic system.

Hydraulic Motor: A device which converts hydraulic fluid power to mechanical force and motion; see Pump.

Intensifier: A device which takes a low-pressure hydraulic input and provides a high-pressure hydraulic output. See Low Pressure and High Pressure.

Low Pressure: 172 Bar (2500 psi) or less of hydraulic pressure; see High Pressure.

lpm: Liters per minute; a measure of hydraulic fluid flow. See Flow.

Micron: One millionth of a meter; approximately 0.00004 in.

Nose Piece: The male fitting of a quick-connect coupler group. See Body Piece.

Open-Center: A constant-flow hydraulic system or tool; the pump output is unloaded to the reservoir when the tool is in the neutral position, and the flow rate at the pump outlet is maintained at the maximum flow control setting. See Closed-Center.

Port: An internal or external opening or passage of a component or tool.

Power Source: A hydraulic unit (consisting of a pump, reservoir, oil cooler, etc., powered by an engine or electric motor) that provides hydraulic flow and pressure to transmit power.

Pressure: Force exerted against an area; measured in pounds per square inch or bar.

Pressure Hose: The hose that carries hydraulic fluid from the pump to the tool.

PSI: Pounds per square inch; a measure of hydraulic pressure. See Pressure.

Pump: A device which converts mechanical force and motion to hydraulic fluid power; see Hydraulic Motor.

Reciprocation: Back-and-forth straight line motion or oscillation.

Relief Valve: A pressure-operated valve that protects the hydraulic system; it prevents the system pressure from exceeding a predetermined setting or maximum value by directing the pump output to go to the reservoir.

Reservoir: A container that stores liquid in a fluid power system; same as Sump or Tank.

Return Hose: The hose that carries exhausted hydraulic fluid from the tool back to the tank.

SAE: Society of Automotive Engineers, an international engineering organization.

Selecter: A valve which allows or prevents the flow of hydraulic fluid; also can control the direction of fluid flow.

Single-Acting: A hydraulic cylinder or tool that allows fluid force in one direction only, with an internal spring or gravity-assisted return; see Double-Acting.

Sump: Same as Reservoir or Tank.

Surge: A momentary increase in system pressure or flow.

Tank: Same as Reservoir or Sump.

Torque: Rotational force; the twisting effort of a fluid motor, expressed as a product of distance multiplied by force (such as inch-pounds or Newton-meters).

Two-Port Valve: A directional control valve with two flow paths; see Four-Port Valve.

Valve: A device which controls the direction, pressure, and flow rate of hydraulic fluid.

Viscosity: A measure of the internal friction of a fluid, or the resistance of a fluid to flow; measured in S.U.S. (Saybolt Universal Seconds) or centistokes.
